

Mesoblast

Phase III study start

Pharma & biotech

Positive data in discogenic low back pain

Mesoblast has reported positive results from its 100-patient Phase II trial of mesenchymal precursor cells (MPCs) in patients with chronic moderate-to-severe discogenic low back pain. The data show strong indications of sustained efficacy across a broad range of clinical and radiographic parameters and support a planned move into Phase III studies. We maintain our recently increased valuation of A\$3.0bn (A\$9.06/diluted share), noting that the use of a higher probability (50%) to reflect a possible Phase III start of the two spinal programmes would increase the rNPV to A\$3.2bn or A\$10.04/share.

Year end	Revenue (A\$m)	PBT* (A\$m)	EPS* (c)	DPS (c)	P/E (x)	Yield (%)
06/12	27.8	(38.6)	(21.6)	0.0	N/A	N/A
06/13	24.2	(48.8)	(17.2)	0.0	N/A	N/A
06/14e	16.2	(76.9)	(24.1)	0.0	N/A	N/A
06/15e	16.2	(82.1)	(25.6)	0.0	N/A	N/A

Note: *PBT and EPS are normalised, excluding intangible amortisation, exceptional items and share-based payments.

Positive 12-month results in disc repair

Mesoblast has reported highly positive 12-month results from its 100-patient Phase II trial of MPCs in patients with chronic moderate-to-severe discogenic low back pain. The data show strong indications of sustained efficacy across a broad range of clinical and radiographic parameters after a single intra-disc injection and support the planned move into Phase III studies. Mesoblast intends to meet with regulatory authorities shortly to discuss the design of the registration trial.

Plan to start Phase III studies

The disc repair programme is one of two spinal programmes with MPC, both of which are proprietary (ie they fall outside the scope of the alliance with Teva). The second is the use of MPCs for lumbar spinal fusion. Both programmes may enter Phase III trials late this year, depending on the outcome of partnership discussions.

Teva moving ahead in CHF

Meanwhile, Mesoblast's partner Teva is set to recruit the first patients into its pivotal Phase III study of MPCs, coded as CEP-41750, in congestive heart failure (CHF), possibly as early as this week. CHF is the most important of the seven different indications being pursued with the MPC platform and, with US\$4bn peak sales potential, it represents the largest component in our valuation.

Valuation: rNPV of A\$3.0bn (A\$9.06/diluted share)

Edison maintains its recently updated valuation of A\$3.0bn (A\$9.34/share basic or A\$9.06/share fully diluted). The potential start of Phase III trials in disc repair and spinal fusion would be allow for the use of a higher probability (50%) and increase the rNPV to A\$3.2bn or A\$10.04/share.

Business description

Mesoblast is developing adult stem cell therapies based on its proprietary MPC and culture-expanded MSC platforms. It has six late-stage clinical trials across four areas: immunologic/inflammatory (Phase III), spine disease (Phase II), cardiovascular (Phase III) and cancer (Phase III). The CV and BMT areas are partnered with Teva, and worldwide manufacturing of MPCs will be provided by Lonza.

Update: Positive results in disc repair

Mesoblast has announced positive 12-month results from its 100-patient Phase II trial of mesenchymal precursor cells (MPCs) in patients with chronic moderate-to-severe discogenic low back pain (ie lumbar degenerative disc disease or DDD). The data show strong indications of sustained efficacy across a broad range of clinical and radiographic parameters after a single intradisc injection and support a planned move into Phase III studies. Mesoblast intends to meet with regulatory authorities shortly to discuss the design of the registration trial in this indication.

The Phase II trial enrolled 100 patients with moderate to severe low back pain, caused by early disc degeneration (less than 30% disc height loss, 83% below Pfirrmann Grade 5 by MRI). Enrolled subjects had chronic low back pain (>six months) due moderate DDD in the lumbar spine (from L1 to S1), which was unresponsive to three months of conservative therapy (including physiotherapy). Patients were randomised to one of four treatment groups, two control (saline and hyaluronic acid or HA) and two active (6m MPCs and 18m MPCs). Patients will be evaluated for safety and efficacy over a total of 36 months to evaluate long-term treatment effects.

Results from the 12 month evaluation are shown in Exhibit 4. The large majority of the outcome measures showed a statistically significant improvement vs controls with MPC-treated patients using less opioids for pain relief, achieving greater radiographically-determined disc stability and a lower requirement for additional surgical and non-surgical treatment interventions. From a clinical perspective, MPC was equally effective at the lower and higher dose.

Outcome measure	Saline (n=20)	HA (n=20)	6m MPCs (n=30)	18m MPCs (n=30)
Improvement in chronic low back pain				
Reduction in mean pain score (VAS) vs baseline	27 points	27 points	37 points, p=0.11*	40 points, p=0.046*
Prop of pts achieving >50% reduction in pain score	31%	35%	69%, p=0.009	62%, p=0.038
Prop of pts achieving minimal residual back pain (VAS<20)	18% (pooled)	52%, p=0.01	42%, p=0.05
Mean daily opioid use, tablet/day	1.00	0.94	0.77	0.58, p=0.17 vs saline
Mean opioid use in pts achieving >50% reduction in pain score	1.3	1.2	0.7	0.6
Need for additional surgical/non-surgical intervention for persistent pain	25%	10%	6.9% (p<0.05)*	3.3% (p<0.05)*
Time to first additional treatment intervention	N/A	N/A	p=0.023 vs saline	p=0.010 vs saline
Improvement in function				
Reduction in mean disability score (Oswestry Disability Index, ODI)	28%	30%	35%	43%, p=0.09 vs saline
Prop of pts achieving min residual functional disability (ODI score <20)	18% (ړ	pooled)	36%, p=0.14	39%
Improvement in disc stability				
Reduction in radiographically-determined translational movement of the disc	3.5%	2.5%	2.0%	1.3%, p=0.021
Source: Mesoblast. Note: *Vs pooled controls.				

vicsobiast. Note. Vs pooled controls.

Discogenic back pain is the result of a complex process initiated by degeneration and loss of proteoglycan and water content of the nucleus pulpous, and increased stress on and fissure formation of the annulus fibrosis. Treatment varies from conservative options (analgesia, anti-inflammatory agents, epidural steroid injection) to surgical intervention (spine fusion, discectomy or artificial disc replacement).

While the majority of patients are treated non-surgically, more severe cases may require surgery. Chronic lower back pain can result from a wide variety of conditions including DDD. Major risk factors are age, genetics and mechanical injury/stresses to the disc. This leads to structural disruption and cell-mediated changes in disc composition. Some 30m people in the US suffer from lower back pain, of which c 15% (c 4.5m) fail to respond to conservative therapy. A proportion (c 500,000) has severe DDD that warrants surgery, which leaves c 4m with limited options. We estimate that 25% (c 1m) have moderate DDD that could be targeted with MPC injections. Exhibit 5 outlines our key model assumptions for MPCs in DDD.

	US	Europe	Total	Notes

Peak market share, n (%)	20%	20%		Limited non-surgical treatment options for moderate lumbar DDD.
Pricing (US\$)	5,000	3,750		Medtronic's InFuse (BMP-2) typically costs c US\$5,000 in the US.
Peak in-market sales (US\$m)	1,210	621	1,831	
Peak revenues to Mesoblast (US\$m)	363	186	549	Assumes product is partnered before/during Phase III development. Forecast transfer price equivalent to 30% of net sales price.

Spinal fusion programme

The disc repair programme is one of two spinal programmes with MPC, both of which are proprietary (ie they fall outside the scope of the alliance with Teva). The second is the use of MPCs for lumbar spinal fusion. Both programmes may enter Phase III trials later this year.

Lumbar spinal fusion surgery is undertaken in patients who have severe lower back and/or neurological deficits that have not responded to conservative treatment. It is considered in conditions such as severe DDD, spinal disc herniation and spondylolisthesis (slipped disc). The procedure is to fuse two or more lumbar vertebrae, eliminating motion between them and decreasing pain from the joint. This is achieved by surgical placement of bone – an autograft (from the hip) or allograft (donor bone or demineralised bone matrix [DBM]) - or a bone-replacement (bone morphogenic protein) between the vertebrae. This stimulates the body's natural bone growth processes.

The standard against which all bone grafts are measured is autograft. However, because a procedure is required to harvest bone (from the hip) potential drawbacks include: poor candidate for harvesting, a longer surgical procedure, harvest-site infection, increased recovery time and longterm pain. An alternative to bone grafting is NuVasive's Osteocel Plus, an allograft cellular matrix that contains living bone cells (mesenchymal stem cells, osteoprogenitor cells) and a DBM scaffold. Osteocel is not FDA regulated (it came to market via the HCT/P pathway) and did not undergo extensive clinical trials.

Results of a Phase II FDA study of MPCs in lumbar fusion that were reported last year showed comparable efficacy and safety outcomes to autograft without the requirement for a boneharvesting procedure (and its associated risks). The open-label study recruited 24 patients undergoing 1- or 2-level (ie two or three vertebrae) lumbar interbody fusion via posterior procedures. Enrolled subjects had lumbar DDD, clinical symptoms of neurogenic pain, and failed six months of conservative therapy. Patients were randomised to receive 25m MPC (n=8), 75m MPC (n=8) or autograft (n=8), with the latter taken from the patient's hip (iliac crest). Results from 23 patients were available at 12 months and are shown in Exhibit 6.

Exhibit 6: Phase II results in lumbar spinal fusion						
Spinal fusion success	Comparable rates of fusion for all three groups, although 25m (7 pts, 86%) was slightly better than autograft (6 pts, 75%) and 75m (five pts, 63%).					
Pain relief	MPCs (both doses) and autograft offered similar improvements in back pain relief at 12 and 24 months.					
Blood loss	Significantly lower (30-43%) reduction in blood loss versus autograft, although we view the absolute reduction (120-170ml) as unlikely to be clinically meaningful. The higher blood loss for autograft likely relates to the surgical harvesting of iliac crest bone.					
Safety	No reoperations/revisions in any groups, similar AE rate across all groups, no treatment-related SAEs, no heterotopic (abnormal) bone formation, and no immune responses.					
Source: Edison Inve	stment Research					

An estimated 1.7m spinal fusion procedures were performed globally in 2011, of which 1m (c 60%) were lumbar. The US represents the largest market with c 380k lumbar fusions undertaken in 2012. We estimate that posterior approaches account for c 60% (228k) of procedures. In Europe, we estimate that c 350k lumbar fusions are undertaken annually, resulting in c 175k posterior

approaches. As a cross reference for Europe, recent UK data (2010/11) indicate that c 35k surgical procedures are undertaken annually in the UK for back pain or radicular pain, the majority of which are lumbar fusions/decompressions.

	US	Europe	Total	Notes
Addressable market – 2013	230k	170k	400k	US: estimated 380k lumbar spinal fusions, of which 60% (230k) posterior approaches. EU: estimated 350k lumbar fusions, with 60% (175k) posterior.
Launch year (FY)	2019	2019		Assumes Phase III start in 2014, data 2017, submission 2018, approval/launch H119.
Peak year (FY)	2024	2024		Peak sales at year six post launch.
Peak market share, n (%)	40%	40%		Unmet need for alternative spinal fusion products that are safer (than Medtronic's InFuse), more convenient (than autografts) and better regulated (than Osteocel).
Pricing (US\$)	5,000	3,750		MPC dose is 25m or 75m on carrier graft. Medtronic's InFuse (BMP-2) typically costs c US\$5,000 in the US.
Peak in-market sales by partner (US\$m)	590	293	883	Peak sales of InFuse were c US\$900m. Global market for bone graft substitutes US\$1.6bn in 2012 (70% from spinal fusions)
Peak revenues to MSB (US\$m)	177	88	265	Assumes NeoFuse is partnered before/during Phase III trial. Forecast transfer price equivalent to 30% of net sales price.

Source: Edison Investment Research

Sensitivities

Mesoblast remains subject to the risks typically associated with biotech company drug development, including the possibility of unfavourable outcomes in clinical trials and regulatory reviews, success of competitors, and commercial decisions by partners or potential partners. The key stock-specific sensitivity is the future of the Teva alliance – this partnership underwrites the development of MPCs in three major therapeutic areas (CHF, AMI and BMT).

Valuation

Edison maintains its recently updated valuation of A\$3.0bn (A\$9.34/share basic or A\$9.06/share fully diluted). The potential start of Phase III trials in disc repair and spinal fusion would allow for the use of a higher probability (50%) and increase the rNPV to A\$3.2bn or A\$10.04/share.

Financials

Mesoblast has filed an Appendix 3c, which shows that cash was A\$250m as of 30 December. We have adjusted our financial model to reflect a higher manufacturing and commercialisation spend, now A\$35m, than was previously modelled (A\$23m), in the light of the A\$17.5m spent in H1. Forecast R&D spend is unchanged at A\$47.4m for FY14 (A\$21.5m was spent in H1) and A\$47.9m in FY15. On this basis, operating cash outflow would be c A\$94-95m/year over the next three years. In the absence of additional financing and/or partnerships, our model now suggests the cash runway extends into FY17.

Revenues principally comprise staged recognition of the US\$130m Teva upfront (A\$16.2m/year). We have not modelled any revenue from partnering of spinal indications, but assume that potential future partners would fund all or part of Phase III trials or G&A.

Edison, the investment intelligence firm, is the future of investor interaction with corporates. Our team of over 100 analysts and investment professionals work with leading companies, fund managers and investment banks worldwide to support their capital markets activity. We provide services to more than 400 retained corporate and investor clients from our offices in London, New York, Frankfurt, Sydney and Wellington. Edison is authorised and regulated by the Financial Conduct Authority (www.fsa.gov.uk/register/firm/BasicDetails.do?sid=181584). Edison Investment Research (NZ) Limited (Edison NZ) is the New Zealand subsidiary of Edison. NZ is registered on the New Zealand Financial Services only. Edison Investment Research Inc. (Edison US) is the US subsidiary of Edison and is not regulated by the Securities and Exchange Commission. Edison Investment Research Limited (Edison Aus) [46085869] is the Australian subsidiary of Edison and is not regulated by the Australian Securities and Investment Commission. Edison Germany is a branch entity of Edison Investment Research Limited [4794244]. www.edisongroup.com

DISCLAIMER

Copyright 2014 Edison Investment Research Limited. All rights reserved. This report has been commissioned by Mesoblast and prepared and issued by Edison for publication globally. All information used in the publication of this report not publical variables sources that are believed to be reliable, however we do not guarantee the accuracy or completeness of this report. Opinions contained in this report represent those of the research department of Edison at the time of publication. The securities described in the Investment Research may not be eligible for sale in all jurisdictions or to certain categories of investors. This research is issued in Australia by Edison Aus and any access to it, is intended only for "wholesale clients" within the meaning of the Australian Corporations Act. The Investment Research is distributed in the United States by Edison US to major US institutional investors only. Edison US is not registered as an investment adviser with the Securities and Exchange Commission. Edison US relies upon the "publishers" exclusion" from the definition of investment adviser under Section 202(a)(11) of the Investment Advisers Act of 1940 and corresponding state securities laws. As such, Edison does not offer or provide personalised advice. We publish information about companies in which we believe our readers may be interested and this information reflects our sincere opinions. The information that we provide or that is derived from our website is not intended to be, and should not be construed in any manner whatsoever as, personalised advice. Also, our website and the information provided by any subscriber or prospective subscriber as Edison's solicitation to effect, or attempt to effect, any transaction in a security. The research in this document is intended for New Zealand resident professional financial advisers or brokers; and habitual investors who are "wholesale clients" for the purpose of the Financial Advisers Act 2008 (FAA) (as described in sections 5(c) (1)(a), (b) and (c) of the FAA).
